

Ferromagnetic nanoparticles for induction heating and their synthesis

Under oscillating magnetic field excitation, ferromagnetic nanoparticles undergo fast heating. However particles suffer from low capacity to convert electromagnetic energy into heat that hampers their wide use.

DESCRIPTION*

- 2 steps synthesis:
 - Synthesis of Iron nanoparticles
 - Carburization of nanoparticles
 - H₂/CO₂ atmosphere at 150°C
- Iron carbide nanoparticles with superior heating properties:
 - Specific absorption rate about 100 X state of the art particles

Photos: LPCNO.

TECHNICAL SPECIFICATIONS

Specific Absorption Rate	> 3 kW/g at 100 kHz, 47 mT
Material	Fe / C (Iron carbide)
Size	10 to 20 nm (Optimal at 15 +/- 2 nm)
Crystallography	Fe _{2,2} C > 70 % mol

COMPETITIVE ADVANTAGES

- Energy saving
- Material saving
- Instantaneous & local heating
- Permanent properties
- Scalable process
- Functionalizable
- Water-dispersible
- Non-toxic material

APPLICATIONS

- Material / Transport
 - Plastic welding
- Chemistry
 - Heterogeneous catalysis

INTELLECTUAL PROPERTY

- Patent pending

DEVELOPMENT STAGE

- Technology validated at lab level

LABORATORY

- Nanostructures and Organometallic Chemistry group
